Please find below and/or attached an Office communication concerning this application or proceeding.

U.S. Patent and Trademark Office PTOL-326 (Rev. 7-05)

Paper No(s)/Mail Date _

3) Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)

5) Notice of Informal Patent Application (PTO-152)

6) Other:

Application/Control Number: 09/754,018 Page 2

Art Unit: 2131

1	This action is in response to the communication filed on 6/29/2003.				
2	DETAILED ACTION				
3	Continued Examination Under 37 CFR 1.114				
4	A request for continued examination under 37 CFR 1.114, including the fee set forth in				
5	37 CFR 1.17(e), was filed in this application after final rejection. Since this application is				
6	eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e)				
7	has been timely paid, the finality of the previous Office action has been withdrawn pursuant to				
8	37 CFR 1.114. Applicant's submission filed on 6/29/2005 has been entered.				
9	Response to Arguments				
10	Applicant's arguments with respect to claims 1-3, and 5-9 have been considered but are				
11	moot in view of the new ground(s) of rejection.				
12	Claims 1-3, and 5-9 have been examined. Claim 4 has been cancelled.				
13	All objections and rejections not specifically set forth below have been withdrawn.				
14	14 Drawings				
15	The drawings are objected to under 37 CFR 1.83(a). The drawings must show every				
16	feature of the invention specified in the claims. Therefore, the data scramble circuit acting as				
17	part of an error correction circuit must be shown or the feature(s) canceled from the claim(s). No				
18	new matter should be entered.				
19	Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to				
20	the Office action to avoid abandonment of the application. Any amended replacement drawing				
21	sheet should include all of the figures appearing on the immediate prior version of the sheet,				
22	even if only one figure is being amended. The figure or figure number of an amended drawing				

Application/Control Number: 09/754,018 Page 3

Art Unit: 2131

should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure 1 must be removed from the replacement sheet, and where necessary, the remaining figures must 2 be renumbered and appropriate changes made to the brief description of the several views of the 3 drawings for consistency. Additional replacement sheets may be necessary to show the 4 renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an 5 6 application must be labeled in the top margin as either "Replacement Sheet" or "New Sheet" pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will 7 be notified and informed of any required corrective action in the next Office action. The 8 9 objection to the drawings will not be held in abeyance. Claim Rejections - 35 USC § 103 10 The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all 11 obviousness rejections set forth in this Office action: 12 13 A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences 14 between the subject matter sought to be patented and the prior art are such that 15 the subject matter as a whole would have been obvious at the time the invention 16 was made to a person having ordinary skill in the art to which said subject matter 17 pertains. Patentability shall not be negatived by the manner in which the 18 19 invention was made. 20 21 Claims 1, 3, and 6-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hirotani (US Patent Number 5,982,887), further in view of Oishi (US Patent Number 6,907,125), 22

Regarding claim 1, Hirotani disclosed a control program for controlling an operation of a microprocessor (See Hirotani Col. 4 Paragraph 3), the control program comprising a concealed program (See Hirotani Col. 3 Paragraph 7), recoverable by data scramble circuit (See Hirotani

and further in view of Schneier (Applied Cryptography).

23

24

25

26

Art Unit: 2131

1 Col. 3 Paragraph 8) and a non-concealed program (See Hirotani Fig. 1 Element 15 wherein only

part of the program is encrypted). However, Hirotani failed to disclose the data scramble circuit

being a hardware circuit acting as part of an error correction circuit.

Oishi teaches that in order to protect against errors in a decryption system, error correction can be combined with the decryption system by encrypting error correction codes as well as the stored data and then decrypting the codes and using the codes in error correction (See Oishi Col. 3 Paragraph 4 and Col. 4 – Col. 6 Line 23)

Schneier teaches that encryption and decryption can be performed in a hardware circuit (See Schneier Pages 223-225).

It would have been obvious to the ordinary person skilled in the art at the time of invention to employ the teachings of Oishi and Schneier in the decryption system of Hirotani by utilizing the decryption/error correction system of Oishi for the decryption of Hirotani and further by providing a hardware decryption circuit to be used in place of the CPU decryption. This would have been obvious because the ordinary person skilled in the art would have been motivated to protect the integrity of the program in a cost efficient manner, and further would have been motivated to increase the speed of the decryption, increase the security of the decryption, ease in the installation of the decryption method, and increase the efficiency of the CPU.

Regarding claim 3, the combination of Hirotani disclosed a device, comprising: a microprocessor (See Hirotani Fig. 3 Element 21), a program memory for storing a control program for controlling an operation of the microprocessor (See Hirotani Fig. 3 Element 25), the control program including a concealed program (Element 25 Encrypted Section) and a non-

hardware circuit acting as part of an error correction circuit.

Art Unit: 2131

concealed program (Element 25 Program section); a rewritable memory for storing a copy of the concealed program copied from the concealed program stored in the program memory (See Hirotani Col. 6 Paragraph 2 and the rejection of claim 1 above wherein it was inherent that the encrypted program was stored, at least temporarily in a rewritable memory in the decryption circuit, before decryption), and a data scramble circuit for recovering the concealed program stored in the rewritable memory as a recovered program (See Hirotani Col. 6 Paragraphs 2-3 and the rejection of claim 1 above), but failed to disclose that the data scramble circuit was a

Oishi teaches that in order to protect against errors in a decryption system, error correction can be combined with the decryption system by encrypting error correction codes as well as the stored data and then decrypting the codes and using the codes in error correction (See Oishi Col. 3 Paragraph 4 and Col. 4 – Col. 6 Line 23)

Schneier teaches that encryption and decryption can be performed in a hardware circuit (See Schneier Pages 223-225).

It would have been obvious to the ordinary person skilled in the art at the time of invention to employ the teachings of Oishi and Schneier in the decryption system of Hirotani by utilizing the decryption/error correction system of Oishi for the decryption of Hirotani and further by providing a hardware decryption circuit to be used in place of the CPU decryption. This would have been obvious because the ordinary person skilled in the art would have been motivated to protect the integrity of the program in a cost efficient manner, and further would have been motivated to increase the speed of the decryption, increase the security of the

Art Unit: 2131

decryption, ease in the installation of the decryption method, and increase the efficiency of the CPU.

Regarding claim 6, the combination of Hirotani disclosed a method for creating a control program, comprising: a program descramble step of descrambling a portion of a control program by reverse scramble of a data scramble circuit in a device to be controlled, thereby creating a concealed program as a portion of the control program (it was inherent in the invention of Hirotani that a portion of the control program was encrypted in order for the control program to have taken on the form of Element 25 in Fig. 3); and a program storing step of storing the control program including the concealed program in a program memory so that the control program controls an operation of a microprocessor in the device to be controlled (See Hirotani Col. 5 lines 39-44), but failed to disclose that the data scramble circuit was a hardware circuit acting as part of an error correction circuit.

Oishi teaches that in order to protect against errors in a decryption system, error correction can be combined with the decryption system by encrypting error correction codes as well as the stored data and then decrypting the codes and using the codes in error correction (See Oishi Col. 3 Paragraph 4 and Col. 4 – Col. 6 Line 23)

Schneier teaches that encryption and decryption can be performed in a hardware circuit (See Schneier Pages 223-225).

It would have been obvious to the ordinary person skilled in the art at the time of invention to employ the teachings of Oishi and Schneier in the decryption system of Hirotani by utilizing the decryption/error correction system of Oishi for the decryption of Hirotani and further by providing a hardware decryption circuit to be used in place of the CPU decryption.

Art Unit: 2131

1 This would have been obvious because the ordinary person skilled in the art would have been

Page 7

- 2 motivated to protect the integrity of the program in a cost efficient manner, and further would
- 3 have been motivated to increase the speed of the decryption, increase the security of the
- 4 decryption, ease in the installation of the decryption method, and increase the efficiency of the
- 5 CPU.

16

17

18

19

20

21

22

Regarding claim 8, the combination of Hirotani disclosed a method for operating a

7 control program, comprising: a program copying step of copying a concealed program which is a

portion of the control program (See Hirotani Fig. 3 Element 25) from a program memory into a

rewritable memory (See rejection of claim 3 above); a program recovery step of recovering the

concealed program copied by the program copying step as a recovered program by a data

scramble circuit (See rejection of claim 3 above); and a program execution step of executing a

non-concealed program included in the control program and the recovered program (See Hirotani

Col. 6 Paragraph 5), but failed to disclose that the data scramble circuit was a hardware circuit

acting as part of an error correction circuit.

Oishi teaches that in order to protect against errors in a decryption system, error correction can be combined with the decryption system by encrypting error correction codes as well as the stored data and then decrypting the codes and using the codes in error correction (See Oishi Col. 3 Paragraph 4 and Col. 4 – Col. 6 Line 23)

Schneier teaches that encryption and decryption can be performed in a hardware circuit (See Schneier Pages 223-225).

It would have been obvious to the ordinary person skilled in the art at the time of invention to employ the teachings of Oishi and Schneier in the decryption system of Hirotani by

Application/Control Number: 09/754,018 Page 8

Art Unit: 2131

21

22

1 utilizing the decryption/error correction system of Oishi for the decryption of Hirotani and 2 further by providing a hardware decryption circuit to be used in place of the CPU decryption. 3 This would have been obvious because the ordinary person skilled in the art would have been 4 motivated to protect the integrity of the program in a cost efficient manner, and further would have been motivated to increase the speed of the decryption, increase the security of the 5 6 decryption, ease in the installation of the decryption method, and increase the efficiency of the 7 CPU. 8 Regarding claim 7, the combination of Hirotani, Oishi, and Schneier disclosed that the 9 program descramble step includes the steps of: creating a non-concealed program (it was 10 inherent that the program was created at some point in order for the program to have been 11 encrypted and downloaded); and synthesizing the concealed program and the non-concealed 12 program into the control program (See Hirotani Fig. 3 Element 25 wherein the encrypted and 13 non-encrypted programs are together as the program stored in program memory). 14 Regarding claim 9, the combination of Hirotani, Oishi and Schneier disclosed a program 15 erasure step of erasing the recovered program from the rewritable memory (See Hirotani Col. 6 16 Paragraph 6). 17 Claims 2, and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over the 18 combination of Hirotani, Oishi, and Schneier disclosed as applied to claims 1 and 3 respectively 19 above, and further in view of Oualline ("Practical C++ Programming") and Ooi et al. (U.S. 20 Patent Number 5,226,129) hereinafter referred to as Ooi.

The combination of Hirotani, Oishi, and Schneier disclosed a recoverable encrypted program to be run on a microprocessor (See rejection of claim 1 above) but Hirotani failed to

Art Unit: 2131

6

7

20

21

22

disclose the composition of the program as well as the addressing mode of the program.

2 However, Hirotani did disclose that the encrypted program could have been downloaded over a

Page 9

3 network (See Hirotani Col. 3 Lines 27-29).

4 Oualline teaches that in order to conserve memory space, commonly used code can be

5 grouped into functions such that the code can be used repeatedly (See Oualline Page 133

Paragraph 1). Ooi teaches that in order to easily make a program portable, the program should

use relative addressing (See Ooi Col. 1 Lines 27-33).

It would have been obvious to the ordinary person skilled in the art at the time of invention to employ the teachings of Oualline to create functions in the encrypted program of Hirotani, Oishi, and Schneier. This would have been obvious because the ordinary person skilled in the art would have been motivated to make the program as compact as possible in order to conserve memory and also to limit the amount of information needing to be transferred over the network to the system of Hirotani. It further would have been obvious to the ordinary person skilled in the art at the time of invention to employ the teachings of Ooi in the program of Hirotani, Oishi, and Schneier by providing the program with relative addressing. This would have been obvious because the ordinary person skilled in the art would have been motivated to minimize the modification of the code required to relocate the program, and thus increase portability.

It would have been obvious in the combination of Hirotani, Oishi, Schneier, Oualline, and Ooi that relative address lists for the functions of the program would be provided in the program at prescribed, or predetermined, location, in order for the processor of Hirotani to be able to locate the functions called throughout the program.
